Applicant's argue that Koyama and Soloff add data to an image to solve different problems and as such there is no motivation to combine the teachings of the references. Examiner agrees with Applicant's assessment of the references.

Claims 1, 3, and 5-7 are herein deemed allowable over the prior art of record, the reasons for allowance are as follows:

In regards to claim 1 the prior art of record does not disclose nor fairly suggest an image data processing method comprising the steps of: storing image data of a screen into memory means, said image data having M lines and N pixels; reading the image data from the memory means in a unit of block having K lines and L pixels in each of said K lines and processing the read image data in the unit of block; and when the image data is read in the unit of block having said K lines and said L pixels and the read image data is short of the unit of block, said M lines are divided by said K lines resulting in a first remainder and said N pixels are divided by said L pixels resulting in a second remainder; wherein a number of lines equal to half of said first remainder is added to an upper end of said image data and a lower end of said image data, and wherein a number of pixels equal to half of said second remainder is added to a left end of said image data and a right end of said image data.

Examiner notes that while Koyama discloses adding data to an image data such that a unit of block can be evenly divided into the image data, Koyama does not disclose adding the data equally on the sides. Examiner further notes that while Soloff discloses adding dummy data equally to end sides of a raster of image data to eliminate edge distortion there is no motivation to combine the teachings of Koyama and Soloff.
